

Problem Statement

- Existing Main Application is developed and hosted on Power Apps (Model-Driven App / Dataverse)
- Only users with premium subscription (*Power Apps premium license*) can access the modules in the Main Application
- Many users are assigned to the records in the Main Application but cannot respond / update the records since they do not have access (license limitations)
- An alternative solution is needed to make a particular module accessible to general users through a simple UI, at minimal cost and without need for additional license subscription

Key Features

- Near real-time data sync between Dataverse tables (Issues Table, Projects Table) and SharePoint List
- Canvas App (Home screen) to display list of relevant records assigned to logged-in user
- UI to include read-only and editable data fields for user to update the record on SharePoint and sync back to Dataverse directly

Solution Outline
